CATPASS Cargo Solutions

for the King Air

Add 113 cubic feet of cargo space to your King Air with three enhancements from Commuter Air Technology. Lightweight and user friendly, our Cargo Pod, Extended Fuselage Nose and Nacelle Wing Lockers will greatly enhance the utility of your aircraft and, in turn, your overall productivity.

Benefits

- Carry more
- Accommodate oversize cargo, baggage, and special mission equipment
- Improve performance
- Improve appearance

Cargo Pod

Weighing in at just over 100 pounds, the carbon composite Cargo Pod adds an impressive 60 cubic feet of space while carrying a useful load of 500 pounds. That's more than enough room to carry the baggage of a planeload of people or for oversized cargo such as oil drilling bits, multiple snow skis, and other specialized equipment. Installed beneath the fuselage, the Cargo Pod may be quickly removed in less than 30 minutes. Not surprisingly, the Cargo Pod is a popular enhancement among commercial airlines and government special mission operations.

Extended Fuselage Nose

The addition of the Extended Fuselage Nose will enhance the beauty, agility and capability of your aircraft. The nose extension enables King Air operators to carry an additional 550 pounds of cargo, including 150 pounds of installed avionics. The nose's front and rear compartments are connected, allowing convenient storage of objects up to almost 6 feet long. What's more, the Extended Fuselage Nose enhancement reduces center of gravity concerns for special mission aircraft operating over 12,500 pounds maximum gross weight and improves the King Air's performance, flight handling and aerodynamic characteristics.

Nacelle Wing Lockers

Further maximize the cargo capacity of your King Air with Nacelle Wing Lockers. These conveniently located, easy-to-reach storage areas add 16 cubic feet of cargo space to your King Air and are ideal for stowing luggage and other moderately sized items. In addition, Nacelle Wing Lockers are lightweight, reduce aircraft drag and stay clean and dry.

What better way to maximize productivity than by expanding the carrying capacity and overall utility of your King Air?
