CATPASS Wilderness Tires

for the King Air

CATPASS high-flotation tires were developed in direct response to requests from clients operating in remote regions and in inclement weather. After extensive testing in the most extreme conditions, Wilderness Tires were born.

Wilderness Tires are a great option for operators of standard gear aircraft seeking the soft field takeoff and landing capabilities of a high float-equipped King Air. They have the added benefit of extending tire life by 30 percent.

FAA approved for King Air F-90/100/200 and Beech 99. Kit includes 4 tires and STC. Optional Cleveland wheels and brakes available.

As a result, operators are able to fly in and out of remote airfields with ease, and takeoffs and landings on hard runways are both smoother and safer. The extra height of Wilderness Tires also reduces the potential for prop damage. In addition, unlike other, expensive, high-flotation gear systems, the addition of affordable Wilderness Tires will not compromise climb or cruise speed performance.

Benefits

- Increase tire life
- Improve landing performance
- Enhance ground roll safety
- Increased capacity for buoyancy
- Reduce potential for prop damage
- Maintain climb and cruise performance
- Increase comfort through smoother ride
- Expanded landing options

What better way to gain the advantages of a high-flotation gear system at a fraction of the cost?
